

UNDERWRITER

Volatility insurance. Governed by evidence.

The product: get paid when nothing happens

IMPLIED

**What the market
expects**

REALISED

**What actually
happens**

The gap is the volatility risk premium - an insurance premium that exists only in options.

Downside is bounded before the order exists

5 x SPY 761 / 760 put credit spreads

Sell the 761 put. Buy the 760 put as the cap. The second leg defines the worst case before entry.

Defined risk is not a dashboard label. It is encoded in the order legs.

\$75

maximum premium

\$425

maximum loss

760.85

breakeven

The AI has one power: say no

The model can remove a trade. No output can create one.

Risk is deterministic and portfolio-aware

01 REGIME

Blocks every new entry when the tape or volatility term structure is hostile.

02 CORRELATION

Stops a second position from quietly becoming the same bet under another ticker.

03 AGGREGATE DELTA

Caps the book at 150 share-equivalents per \$100k, not just one spread at a time.

04 LOSS + KILL

Daily loss, open-risk, position, cutoff, and global kill gates fail closed on unknowns.

Recovery is proven across both boundaries

Evidence is the product, not the theater

A four-session P&L is weak evidence. Refusals, recovery, and conservative accounting show whether the agent is disciplined.

1,107

passing tests

58

coded refusal reasons

20

documented platform
gotchas

Official paper P&L is reported. Conservative shadow P&L is the number to believe.

**An underwriter that
approves everything is not
an underwriter.**

Paper-only. Defined risk. Every refusal recorded.
Every restart recoverable.
